Operating description

- **Device configuration**

The relay operates when all the phases are present, the phase sequence is correct (not present in versions with N ending) and the phase-phase voltage levels are within set limits.
The relay releases when one or more phase-phase voltages exceeds the upper set level or drops below the lower set level.

► Alarms

DPB01 and PPB01 operate in 2 different modes depending upon the alarm type:
- Phase loss and incorrect phase sequence cause immediate output relay de-energisation.
- Under or over voltage triggering cause output relay to turn OFF at the end of set delay.

Hysteresis	2% fixed
Delay ON	None

► Visual information

DPB01 and PPB01 feature 3 front LEDs which provide operation status information.
- Green LED is ON when the power supply is present.
- Red "AL" LED provides alarm status information: when an over or under voltage alarm is triggered, and there is a delay on alarm elapsing, the LED blinks at 2Hz during the delay. If the alarm situation is still present at the end of delay, the LED turns steady ON.
If a phase is lost or the phase sequence is incorrect, the LED flashes fast at 5Hz.
- Yellow LED is ON when the output relay is energised.
